

# Chloritoid

©2001 Mineral Data Publishing, version 1.2

**Crystal Data:** Monoclinic or triclinic, both pseudo-hexagonal. *Point Group:*  $2/m$  or 1. Rarely as rosettes of pseudo-hexagonal tabular crystals; commonly coarsely foliated with foliae typically curved or bent; massive. *Twining:* Common on {001}, may be lamellar; twin axes [100], [110], and [130] observed.

**Physical Properties:** *Cleavage:* Perfect on {001}, distinct on {110}; parting on {010}. *Tenacity:* Brittle. Hardness = 6.5 D(meas.) = 3.46–3.80 D(calc.) = 3.56

**Optical Properties:** Translucent. *Color:* Dark gray, greenish gray, greenish black; colorless to green in thin section. *Streak:* White, grayish, or very slightly greenish. *Luster:* Somewhat pearly on cleavage surfaces.

*Optical Class:* Biaxial (+) or (-). *Pleochroism:* X = olive-green to yellow; Y = grayish blue to blue; Z = colorless to pale greenish yellow. *Orientation:* X or Y = b (monoclinic);  $Z \wedge c = 2^\circ\text{--}30^\circ$ ;  $Y \simeq b$  (triclinic). *Dispersion:*  $r > v$ , strong.  $\alpha = 1.705\text{--}1.730$   $\beta = 1.708\text{--}1.734$   $\gamma = 1.712\text{--}1.740$   $2V(\text{meas.}) = \sim 45^\circ\text{--}70^\circ$

**Cell Data:** *Space Group:*  $C2/c$ .  $a = 9.50(3)$   $b = 5.50(2)$   $c = 18.22(5)$   $\beta = 101^\circ 57'(5)'$   $Z = 4$ , or *Space Group:*  $C\bar{1}$ .  $a = 9.46(1)$   $b = 5.50(1)$   $c = 9.15(1)$   $\alpha = 97.05(2)^\circ$   $\beta = 101.56(2)^\circ$   $\gamma = 90.10(2)^\circ$   $Z = 4$

**X-ray Powder Pattern:** Natick, Rhode Island, USA.

4.498 (100), 4.449 (100), 2.963 (90), 1.5813 (80), 2.367 (70), 2.306 (70), 2.639 (50)

## Chemistry:

	(1)		(1)
SiO <sub>2</sub>	23.91	CaO	0.04
TiO <sub>2</sub>	0.20	Na <sub>2</sub> O	0.00
Al <sub>2</sub> O <sub>3</sub>	40.12	K <sub>2</sub> O	trace
Fe <sub>2</sub> O <sub>3</sub>	1.23	F	0.01
FeO	27.06	H <sub>2</sub> O <sup>+</sup>	7.03
MnO	0.16	H <sub>2</sub> O <sup>-</sup>	0.01
MgO	0.51	Total	100.28

(1) Natick, Rhode Island, USA; corresponds to  $(\text{Fe}_{1.89}^{2+}\text{Mg}_{0.06}\text{Mn}_{0.01})_{\Sigma=1.96}(\text{Al}_{3.95}\text{Fe}_{0.08}^{3+}\text{Ti}_{0.01})_{\Sigma=4.04}\text{Si}_{2.00}\text{O}_{9.80}(\text{OH})_{3.20}$ .

**Polymorphism & Series:** Forms a series with carboirite; monoclinic and triclinic polytypes are known.

**Mineral Group:** Chloritoid group.

**Occurrence:** In regionally metamorphosed pelitic sediments and schists in the biotite, garnet, and lower grade staurolite zones; in quartz-carbonate veins and other hydrothermal environments.

**Association:** Muscovite, chlorite, staurolite, garnet, kyanite, quartz, mica, rutile.

**Distribution:** A widely distributed mineral; only a few studied occurrences are noted. In Russia, from Kosoï Brod, Mramorskii Zavod, south of Yekaterinburg (Sverdlovsk), Ural Mountains. At Salmchâteau, near Ottré, Ardennes Mountains, Belgium. From Nadels and Zermatt, Valais, Switzerland. At Prägraten, Tirol, Austria. In Scotland, along the coast between Stonehaven and Aberdeen; and from Unst, Shetland Islands. Around Tintagel, Cornwall, England. In the USA, at Natick, Kent Co., Rhode Island; Chester, Hampden Co., Massachusetts; in Clove Valley, Dutchess Co., New York; from Bull Mountain, Patrick Co., Virginia. In Canada, at Chibougamau and St. Giles, Quebec. From Kalgoorlie, Western Australia.

**Name:** For its resemblance to members of the *chlorite* group.
